For example, U.S. Pat. No. 4,475,220 to Mestayer discloses a portable furnace probe. The probe is provided with an expandable bellows for drawing a sample of combustion air into the probe, and a valve for adjusting the draw rate. The probe includes an optical temperature sensor and is used to monitor the temperature of a kiln in a glassware furnace. U.S. Pat. No. 4,491,031 to DeLucia et al. discloses a method and apparatus for determining the quality of a smelting furnace. A method and apparatus for determining the quality of a smelting furnace is disclosed which utilizes an oxygen probe which is activated at a predetermined temperature for the purposes of determining a malfunctioning furnace. In U.S. Pat. No. 4,924,610 to DeLucia et al. a method and apparatus for determining the quality of a smelting furnace is disclosed which utilizes an oxygen probe which is activated at a predetermined temperature for the purposes of determining a malfunctioning furnace. A Peltier probe is used to monitor the temperature of a furnace. The probe uses a Peltier thermoelectric element which measures temperature by using a two-terminal device which is able to detect the Peltier effect. A thermocouple is usually used as the detecting device. The Peltier probe has the advantage of not producing a lot of heat. Also, the Peltier probe has a long life. However, the temperature sensing element in a Peltier probe is very sensitive to local heat, which is caused by the heating elements that are located adjacent to the temperature sensing element. The Peltier probe suffers from short failure times when used as a temperature sensor for a furnace. In 82157476af
